

- Carbon neutrality, equity and development goes somewhere in contradiction.
- Developing countries wants to get developed but issue is that it will emit carbon emission.
- Our pledges in intended nationally determined contribution fall shorts.

What India must do:

- India has one of the lowest per capita carbon emission, show India is already on the path of carbon neutrality.
- India does not owe a carbon debt to the world.
- India's approach to eventual net-zero emissions is contingent on deep first world emissions reductions.
- India's current annual emissions such as to seriously dent the emissions gap
- India must declared itself the carbon neutral country.
